                                                                                                                                                                                                                                                                                                                                                                                       the proteasome.

the proteasome.

SUBUNIT: Component of the multisynthetase complex which is SUBUNIT: Component of the multisynthetase comprised of a bifunctional glutamyl-prolyl-tRNA synthetase, monospecific isoleucyl, leucyl, glutaminyl, methionyl, lysyl, and aspartyl-tRNA synthetases as well as three auxil proteins, pl8, p48 and p43. Binds FUBP1.

SIMILARITY: Contains 1 GST-like domain.

CAUTION: Ref. 1 sequence differs from that shown due to a frameshift in position 312.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Probable core protein of the multisynthetase that serves as a template for the assembly of the suprastructure. Mediates ubiquitination of FUBPl and its deg

Sequence 465 AA;

This sequence is encoded by a gene of the invention, and is implicated in the pathology of Parkinson's disease. This sequence is a variant of the parkin gene found in parkinson's disease patients. The sequences may be used for the diagnosis, treatment (including gene therapy) and investigation of Parkinson's disease

'n

Gene implicated in the pathology of Parkinson's disease, used treatment of the disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to Parkin protein and its corresponding nucleic CC acid sequence. The nucleic acid sequence is useful for altering the protesylvic processing of Parkin at its potential cleavage site at Asp CC 126. The invention is used in manufacturing or testing a pharmaceutical CC composition for treating and/or preventing a neurological disorder, e.g. CC Alzheimer's disease or ischaemic stroke. It also used for detecting the CC cocurrence of proteolytic processing of Parkin at Asp 126 in a sample, in CC monitoring a potential disposition for a neurodegenerative disease, and CC for treating, preventing and/or diagnosing Parkinson's disease or other CC neurodegenerative disorders. The viral vector is used for transforming CC neuronal cells in vivo or ex vivo. The invention is useful for convocation assays to identify compounds that increase or decrease CC apoptosis. It is also used in gene therapy. The present sequence is human constraints assays to identify compounds that increase or decrease constraints in the present sequence is human constraints.

                                                                                                                                                                                                                                                                                                                                                     The invention relates to identifying (M1) a candidate p53 pathway condulating agent, by contacting an assay system comprising a purified HM completed (human orthologue of genes that modify the p53 pathway in cC Drosophila) or nucleic acid with a test agent under conditions, where but cfor the presence of the test agent, the system provides a reference cativity, and detecting a test agent, the system provides a reference contracting a cell defective in p53 pathway of a cell (comprising contacting a cell defective in p53 pathway of a cell (comprising contacting with a candidate modulator contacting a cell defective in p53 function with a candidate modulator contacting a mammalian cell (comprising contacting the cell with an agent that specifically binds to a HM polypeptide comparising (M3) a p53 pathway of a disease in a patient (comprising: (a) obtaining a biological sample comparisor; (b) contacting the sample with a probe for HM comparisor; (c) comparisor indicates a likelihood disease). (M1) is useful contentifying modulators of the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. Comparisors (e.g. cancer). Another two new methods (M2 and contention of the p53 pathway. A probe for HM expression level. Comparisors (e.g. cancer). Another two new methods (M2 and contents) and contents (e.g. cancer). Another two new methods (M2 and contents) are useful for modulating the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring contents. The cell cycle. (M2) and (M3) are useful for modulating the p53 pathway of a cell, thus restoring contents a human p53 pathway modifying protein sequence.
                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240
```

The invention relates to Parkin protein and its corresponding nucleic acid sequence. The nucleic acid sequence is useful for altering the protecolytic processing of Parkin at its potential cleavage site at Asy 126. The invention is used in manufacturing or testing a pharmaceuticity of the invention is used in manufacturing or testing a pharmaceutic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alzheimer's disease or ischaemic stroke. It also used for detecting the occurrence of proteolytic processing of Parkin at Asp 126 in a sample, i monitoring a potential disposition for a neurodegenerative disease, and for treating, preventing and/or disgnosing Parkinson's disease or other neurodegenerative disorders. The viral vector is used for transforming neuronal cells in vivo or ex vivo. The invention is useful for neurotransplantation into the CNS of a mammal. It may be used in screening assays to identify compounds that increase or decrease apoptosis. It is also used in gene therapy. The present sequence is huma Parkin mutant protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 465

This sequence is a variant of the parkin gene found in parkinson's disease patients. The sequences may be used for the diagnosis, treatment (including gene therapy) and investigation of Parkinson's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 437 AA;

                                                                                                                                                                                                                                                                                                               commodulating agent, by contacting an assay system comprising a purified HM college (human orthologue of genes that modify the p53 pathway in college (human orthologue of genes that modify the p53 pathway in college acid with a test agent under conditions, where but for the presence of the test agent, the system provides a reference college are modulating (M2) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator contacting a cell defective in p53 function with a candidate modulator contacting and cell (comprising contacting the cell with an agent that specifically binds to a HM polypeptide comprising an HM amino acid comparison contacting the cell with an agent that specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising; (a) obtaining a biological sample contacting the patient (comparison indicates a likelihood disease). (M1) is useful contentifying modulators of the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. Compatition the p53 pathway. A probe for HM expression contents in the p53 pathway. A probe for HM expression contents in the p53 pathway. A probe for modulators of the p53 pathway. A probe for modulators of the p53 pathway. A probe for modulations of the cancer has greater than 25 % expression level. Content the content has greater than 25 % expression level. Content the content was proposed to related to defects in the p53 pathway of a cell thus restoring the p53 pathway of a cell thus restoring content and thorse disease or disease or disease is related to defects in the p63 pathway of a cell thus restoring content points and content through the cell cycle. (M2) and (M3) are content and content of cell proliferation of the cell, so that the cell cycle. (M2) and (M3) are content and content and content and content and content and content and content and content

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                    The present sequence represents a murine parkin2 polypeptide. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25,2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active
                                                                                                                                                                                                                  Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a murine parkin2 polypeptide. The sequence contains the mutation Thr415Aen. Mutations or deletions in t parkin2 gene cause Parkinson's disease in humans. The human parkin2 is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. The treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, appropriate a disease, Huntington's disease, amyotrophic lateral sclerosis, Multisystem atrophy, Wilson's disease, amyotrophic lateral sclerosis, and secondary causes inducing Parkinson's systems like toxins, drugs, brumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mue

Mutations or deletions in parkin2 gene cause Parkinson's disease in humans. The human parkin2 graits located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multisystem atrophy, Wilson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, b tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin
                                                                                                                                                                                                                         Sequence

The invention relates to identifying (M1) a candidate p53 pathway modulating agent, by contacting an assay system comprising a purified HM polypeptide (human orthologue of genes that modify the p53 pathway in Drosophila) or nucleic acid with a test agent under conditions, where but for the presence of the test agent, the system provides a reference activity, and detecting a test agent—biased activity of the assay system. Also included are modulating (M2) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HM polypeptide comprising an HM amino acid
                                                                                                                                                                                                               Example 2; Page 402-403; 678pp; English.
                                                                                                                                                                                                                                                           Identifying modulators of the p53 pathway for use in or cell proliferation disorders, comprises screening modulate activity of a human ortholog of genes that meaning pathway in Drosophila.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        05-JUN-2001; 2001US-0296076P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cc sequence, where p53 function is restored), modulating (M3) a p53 pathway c in a mammalian cell (comprising contacting the cell with an agent that c specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising: (a) obtaining a biological sample c from the patient; (b) contacting the sample with a probe for HM c expression; (c) comparing the results with a control; and (d) determining the interval of control; and (d) determining c expression indicates a likelihood disease). (M1) is useful c for identifying modulators of the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 * expression level. C modulators identified by (M1) are useful in a variety of diagnostic and therapeutic applications, where disease or disorder prognosis is related to defects in the p53 pathway, such as, angiogenesis, apoptotic or cell c proliferation disorders (e.g. cancer). Another two new methods (M2 and C M3) are useful for modulating the p53 pathway of a cell, thus restoring the p53 function of the cell, so that the cell undergoes normal c proliferation disorders in the p53 pathway such as angiogenic, c apoptotic or cell proliferation disorders. The present sequence c represents a human n53 nathway modificing norterin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a murine parkin2 polypeptide. The polymucleotide sequence contains a deletion, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease, are also useful for amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 344 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides encoding mouse parkin2 protein, useful for producing a transgenic non-human animal as an animal model for neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            30-AUG-1999;

The polypucleotide sequence contains a deletion, leading to a truncated protein. Nutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 625.2-27. Parkin2 polypeptides and polypucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a leas active or non-active parkinson reception.

                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enharyotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL20511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABB5737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```

The present sequence represents a murine parkin2 polypeptide. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral
